

## **Improved Structure Of Artificial Implantable Dental**

### **Abstract of the Disclosure**

5       An artificial implantable dental structure comprises an abutment, an implant, and a normal conical body located between the abutment and the implant. The normal conical body serves to minimize an acute angle that is formed by a conical surface of the normal conical body and a top of the gums at the time when the implant is planted in a bone socket of the mouth cavity, thereby preventing deposition of food particles in contact areas of the implant and the gums.
